G06F017/60

ABSTRACT:

PROBLEM TO BE SOLVED: To improve efficiency in parcel delivery sales jobs by performing a POS(point- of-sales information management) job such as the settlement of account on a parcel delivery destination card while saving labor and time for looking for the destination of parcel delivery by retrieving the information of a map for the destination of parcel delivery, displaying that information, registering the sales of merchandise at the destination of parcel delivery and settling the amount of sales.

SOLUTION: A display device 2 can display the picture of an ordinary POS job

such as sales registration and displays the address  
retrieval picture for the  
destination of parcel delivery and the retrieved map. An  
input device 3  
enables operation required for the POS job such as the  
sales registration and  
enables the input of a retrieval keyword at the time of  
address retrieval and  
operation for selecting any name of a place displayed on  
the screen. A card  
reader 4 is used for reading the information of the card  
when a client requests  
the settlement of account with a credit card, etc., at the  
time of sales  
registration. A GPS control part 8 retrieves the  
destination of parcel  
delivery from current spot information from a GPS, a map  
file on a storage  
device 7 and the address of destination of parcel delivery  
inputted from the  
input device 3.
